THE BEST NON-SURGICAL LASER ASSISTED TREATMENT TO REDUCE CUTANEOUS LAXITY.
ENDOLIFT® IS A MINIMALLY INVASIVE MEDICAL LASER TREATMENT THAT USES EUFOTON® INNOVATIVE LASEMAR® 1500 TO STIMULATE BOTH DEEP AND SUPERFICIAL LAYERS OF THE SKIN, TIGHTEN AND RETRACT THE CONNECTIVE SEPTUM, AND STIMULATE NEW DERMAL COLLAGEN FORMATION.

While passing through the dermis, these FTF® micro optical fibers act like an intradermal light path and transmit laser energy, offering significant, visible results. The procedure involves minimal to no downtime and it does not have the pain or recovery time that is associated with surgical procedures. Patients can return to work and normal activity within a few hours.

The wavelength of LASEMAR® 1500 (1470nm) has an ideal interaction with water and fat, which activates neo-collagenesis and the metabolic functions in the extracellular matrix. This results in skin retraction and tightening.

ENDOLIFT® ADVANTAGES

1. Office based procedure.
2. Only one treatment.
3. Anesthesia: by preference just with air cooling.
4. Safe and immediate results.
5. Long term effect.
6. No incisions.
7. Minimal or no post treatment recovery time.
8. Possibility of therapeutic combination with many surgical and aesthetic treatments.

HOW IT WORKS

The office-based Endolift® treatment requires Eufoton® specific FTF® - Fiber to Fiber system - micro optical fibers, that are easily inserted, without any incisions, under the skin directly in the superficial hypodermis, creating a micro-tunnel orientated along the anti-gravitational vectors and, after the treatment, the fibers are removed. Eufoton® offers several calibers depending on the area to treat: 200 - 300 - 400 - 600 micron.
Results are both immediate and long-term.

The area will continue to improve for several months following the Endolift® procedure as additional collagen builds in the deep layers of the skin.

Results can be enhanced with the combination of LASEmaR® 1500 and LIGHTSCAN™ - a fractional, non-ablative laser treatment.

FTF® - FIBER-TO-FIBER SYSTEM

Endolift® Micro optical fibers are available in two kinds: bare and radial.
